

Ito yung introduction ng Project Context

Information technology now shapes how furniture stores operate, opening paths to better decisions, smoother workflows, and stronger customer connections. Despite this digital transformation shift, numerous shops, especially midsize and smaller ones, still handle sales, stock, client details, and daily tasks through outdated or disconnected processes. Inaccurate figures emerge regularly because of these approaches, slowing down reports while weakening team coordination and strategic choices. Furthermore, product presentation remains to conventional formats, worsened by lack of real-time data updates across functions, dragging down service quality along with business results. Addressing such gaps demands a unified system built around the actual needs of furniture retailers.

Ito yung first module. Yung pattern kasi ni Sir is per paragraph, 1 module. Next yung mga sub-modules like yung HR, after that is the HR components such as Record and Onboarding tapos describe mo yung ginagawa ng component na yun, then next component under HR hanggang maubos. FORMAT: Module -> sub-modules -> components

The system has planned four modules with the first module being the Integrated Management System (IMS). Having eight sub-modules, the Integrated Management System is the main hub for how furniture stores operate daily tasks. The first sub-module of the Integrated Management System is the "Customer and Account Management Module", where as the name suggests, is where the customers and their accounts are managed. It has a Customer Registration component which registers

customers, Contact and Delivery Information component that registers contact numbers and delivery locations, and Purchase and Order history component for recording customer transaction data. Wishlist and Preferences component which pins products selected by the customer and filters customer interest, and Loyalty Program Records component for customer satisfaction. Another sub-module is the "Product and Catalog Management Module", where the products are in the system. It has Furniture Categories module which tags the products by certain criteria, Product Descriptions module that creates product descriptions, Materials-Colors-Finish Options module that creates various options for the selected product, and a Product Availability module that shows available products. The next sub-module is the "Store and Branch Management Module" which houses the store and branch management in the system. It includes Location and Profile Registry component for store location and legal registry data, Localized Catalog and Pricing component for location specific cataloging and pricing, Staff and Role Assignment for personnel management, Branch Inventory Visibility component for checking location specific inventory, and Local Operations and Compliance component for location specific conditions. The next sub-module features the "Inventory and Warehouse Management Module" which manages the product stock. It offers the Stock Quantity Tracking component for tracking product quantity, Warehouse Location Mapping component which records the warehouse locations, Low-stock and Reorder Alerts component for warnings and pop-ups whenever a stock is within a certain quantity, Supplier and Purchase Order Records component for recording supplier transactions, and Damage and Return Logs for recording product quality, damages and returns. The fifth sub-module is the "Order, Sales, and Delivery

Module" which includes the Order Processing component for processing orders of the store, Delivery Scheduling component for creating delivery schedules after the order, Installation Service Tracking component for tracking the installation, and Order Status Monitoring component for observing the current status of the Order. The next sub-module is the "Financial and Billing Management Module" where the payment processing is located. It has Invoicing and Receipt Generation component which generates the transaction record, Payment Processing component which processes the transaction, Installment and Financing Records component which records installments and financing, Sales and Expense Tracking component which observes the sales and expenses records, Profit and Revenue Reports component for showing the profit and revenue. Then the "Human Resources Module" sub-module. It include the Employee Records and Onboarding component for personnel records, Scheduling and Attendance component for employee productivity record, Leave and Absence Management component for employee's missing days record, Payroll and Compensation component for personnel salary, Operational Performance Metrics component for personnel daily productivity metrics, Equipment/Asset Assignment component for auxiliary asset management, and Operational Communication Logs component for operational communication records. Lastly for the Integrated Management System, the "Returns, Refunds, and Service Management Module" sub-module where returns and service are in. Return Request and Authorization component for processing product returns, Inspection and Condition Assessment component for product investigation, Disposition and Restocking Logic component for product replacing and restocking, Refund and Compensation Processing for return

compensation, Analytics and Fraud Prevention component for analytics and processing. This completes the first Module of the system which involves most of the common processes involved in store management.

Ito na yung 2nd Module, tapos same format

The next main module is the 3D Viewer-Order Integration Module which integrates the 3D product viewer and ordering into one system. It features two sub-modules, with the first one being the "3D Furniture Viewer Modules" where the 3D model viewing is. It involves the 3D Model Rendering component for housing the 3D model file and visualizes it, Rotate, Zoom, and Scale Controls component for user interaction with the 3D render, Dimension Display component where the product's dimensions are listed, High Resolution Visualization component for high resolution display. Then the "3D Viewer-Order Integration Module" where the integration is located. It has the Add to Card from 3D View component for processing the order from the 3D view, the Real Time Price Updated Based on Customization component for updating the price as the user selects various options for the product, and the Variant Select Sync component that synchronizes the product variant.
